

Reference case

BAVP

A completely new application has been built that automates and digitizes a previously completely manual process. By means of the platform, sums accruing to the audiovisual works can be registered and passed on to the right holders.

Both employees and producers each have access to the portal, each with their own interface and functionalities.

By means of a digital worker (RPA) the subsidy process is thus fully automated. Publishers can apply for their subsidies. The application is now fully digital and any downstream processing has been fully automated.

Used technologies:

- Vuejs/Nuxtjs
- Java & Spring Boot
- Axon framework
- UIPath RPA
